

Quick Assignment

Mini Assignment: Deconstructing HCI & CG in Daily Software.

Objective: Demonstrate your understanding of the difference between Human-Computer Interaction (HCI) and Computer Graphics (CG) by visually annotating and analyzing an interactive 3D digital tool of your choice.

Software used: Google Earth (Web)

Slide 1: HCI Focused

Element 1: Search Bar

It helps the user to easily find the desired location for his project.

Element 2: Setting Button

It helps the user to set the visuals according to self-requirement.

Element 3: Zoom Controls

It enables the user to view the result at the desired scale.

Slide 2: CG Focused

Element 1: 3D Globe Spherical Geometry

It renders a 3D realistic curved spatial geometry instead of a flat map projection.

Element 2: Realistic Shadow

It renders a clear day-night terminating line along the globe according to the projection of source light.

Element 3: 3D Star Field

It enables the user to access the visual depth of star field.

Short Reflective Questions:

1. How does the Computer Graphics quality (e.g., realistic lighting or 3D view) help or hinder the user's ability to interact with the software?

The high Quality Computer Graphics like 3D Shading and realistic planet curvature view helps the user to easily understand the global model at large scale as well as the terrain elevations in a way that is not possible using a 2D map.

2. What is one simple HCI change you would make to improve the user interface?

One simple change that can improve the user interface and experience is “Recently Searched Location Pinning”. It will help the user to switch between different locations on a single click instead of re-writing the who location.
